

This Week's Training Summary

04 Sep – 10 Sep 2026 · Generated 11 Sep 2026

Week 16 of PPL x2 · Target: 6 sessions/week · W17 = DELOAD

HOW THIS WEEK WENT

Trained **3 of 6 planned days** (50%). Monday–Wednesday sessions were only 45 hours apart — below the 48h minimum your body needs at 44 to fully repair shoulder and leg tissue between sessions.

△ LOW

Bench Press rep collapse: dropped from 60kg×8 (24 Aug) to 60kg×6 (07 Sep). Strength is going backwards on the primary chest lift. Next session moves to 57kg — rebuild reps before adding load.

X

CRITICAL

Lateral Raise (V-taper KPI): FLAT — 10kg×15 reps for the third straight week, no change from 24 Aug or 07 Sep. Love handles sit at lat-width level, collapsing the V silhouette. The KPI is not moving — 11kg next week.

△ FLAT

Rear delts: only 3 sets vs 8-set target (63% short). At 44, when front deltoids overpower rear deltoids, the humeral head is pulled forward in the socket — compressing the supraspinatus tendon and raising rotator cuff impingement risk with every pressing rep.

X

CRITICAL

Zero corrective work all week: no Dead Bug, Bird-Dog, or Hip Thrust in any of 3 sessions — Week 16 and both APT correction and T8-T12 kyphosis correctives are still completely absent. One session (Fri 04 Sep) ran **251 minutes**, far over the 60-min cap.

X

CRITICAL

DO THIS NEXT WEEK (W17 — DELOAD)

1

Monday Push A & Wednesday Legs A: start every session with Dead Bug 3×10 before touching a barbell. It takes 3 minutes. In Week 16 the T8-T12 corrective has never been logged — this is the single easiest habit to add with zero equipment cost.

2

Wednesday Legs A & Saturday Legs B: Hip Thrust is mandatory — 3×10 @ 60kg on both Legs sessions. It has not appeared in any session in 16 weeks. Anterior pelvic tilt is compounding on every squat and deadlift without glute activation to counter it.

3

Tuesday Pull A & Friday Pull B: 3 sets of Rear Delt Reverse Fly (or Face Pull if cable available) at the end of every Pull session — 10kg×12 to start. This is the

minimum to stop the front-to-rear deltoid imbalance from worsening. Target 8+ rear delt sets per week.

- 4 **Monday Push A & Thursday Push B:** Lateral Raise at **11kg** (up from 10kg) — the V-taper KPI has been flat for 3 weeks. Even in a deload week, bump this isolation movement by 1kg to break the stall. This is the primary driver of shoulder-cap width and the only visual fix for the love handle silhouette problem.

W17 is a DELOAD week — 2 working sets per exercise, same weights, full correctives. Return stronger in W18.
