4. ARE THE RIGHT MUSCLES GETTING ENOUGH WORK?

Muscle Group | Sets this wk | Target/wk | Gap | Status

* +-----+-----+-----+-----

Chest		12		12		0		OK
Back		13		14		1		LOW
Shoulders		10		10		0		OK
Traps		6		6		0		OK
Rear Delts		9		8		-1		OK
Biceps		5		8		3		LOW
Triceps		6		8		2		LOW
Legs		9		14		5		CRITICAL
Core		9		6		-3		OK

Push sets: 28 | Pull sets: 33 | Ratio pull:push = 1.18 (OK -- balanced)

Rear delts: 9 sets this week (need 8+/week)

OK -- shoulder balance maintained.

Traps : 6 sets this week (need 6+/week)

OK.

Enough work this week: Chest, Shoulders, Traps, Rear Delts, Core

Short this week : Back, Biceps, Triceps, Legs

Under-trained muscles lose size first on a calorie deficit. Prioritise these next session.

5. REST AND RECOVERY THIS WEEK

Sessions this week : 4 of 5 target

Wk -3 (01 May-08 May): 6 sessions

Wk -2 (08 May-15 May): 6 sessions

Wk -1 (15 May-22 May): 4 sessions

Time between sessions this week:

Mon 25 May 08:12 -> Tue 26 May 10:14: 26h

Tue 26 May 10:14 -> Wed 27 May 08:37: 22h [FLAG: only 22h rest, same muscles: back, biceps, other, traps]

Wed 27 May 08:37 -> Thu 28 May 07:55: 23h [FLAG: only 23h rest, same muscles: back, core, other]

No sessions after midnight IST this week. Good.

Back-to-back sessions hitting the same muscle group:

Mon 25 May + Tue 26 May (26h apart): overlap = chest, other, rear_delts

Tue 26 May + Wed 27 May (22h apart): overlap = back, biceps, other, traps

Wed 27 May + Thu 28 May (23h apart): overlap = back, core, other

At age 44, muscles need 48-72h to fully repair between sessions.

Training a muscle before it has recovered adds fatigue, not stimulus, and raises injury risk. Rearrange sessions to respect the recovery window.

6. BODY RECOMPOSITION CHECK

Calorie target : 2367 kcal/day

TDEE estimate : 2784 kcal/day (your estimated daily burn at current weight)

Daily deficit : 417 kcal (15% cut -- sustainable rate for muscle retention)

Protein target : 174g/day (2g per kg bodyweight)

WHY PROTEIN MATTERS ON A CUT:

In a calorie deficit, the body looks for extra fuel. If protein is low, it breaks down muscle tissue for energy -- this is called muscle catabolism. At 174g/day, you supply enough amino acids to maintain muscle while losing fat. Going below ~120g/day on this deficit risks losing the muscle you are training to build.

MUSCLE STIMULUS CHECK (minimum sets/week to retain muscle on a calorie deficit):

Muscle	This wk	Min	Status
Chest	12	8	OK
Back	13	10	OK
Shoulders	10	8	OK
Traps	6	4	OK
Rear Delts	9	6	OK
Biceps	5	6	AT RISK
Triceps	6	6	OK
Legs	9	10	AT RISK
Core	9	4	OK

Muscles at risk of loss this week (below minimum stimulus):

Biceps, Legs

These are not getting enough signal to hold on to muscle during a deficit.

Add sets for these in the next 1-2 sessions.

Active training weeks logged : 1

Weeks since last deload : 1 (deload every 4 weeks)

Next deload : in 3 week(s), approx 19 Jun 2026

6.5. PPL ADHERENCE & CORRECTIVE COMPLIANCE

Programme week: W1 (started 2026-05-24; 5 days elapsed, rounded up)

Sessions this week: 4 of 6 target (Fri Pull B and Sat Legs B not yet reached at report time)

Day	Expected	Detected	Status
* +-----+-----+-----			
Mon 25 May	Push A	Push A	OK
Tue 26 May	Pull A	Pull A	OK
Wed 27 May	Legs A	Legs A	OK
Thu 28 May	Push B	Push B	OK

Adherence: 100% (4 of 4 completed sessions on correct day)

Note: Fri Pull B and Sat Legs B outstanding -- week still in progress.

CORRECTIVE MARKERS:

Hip Thrust in Legs sessions : 0 of 1 legs sessions -- MISSING on Wed 27 May

* APT CORRECTION AT RISK -- Hip Thrust is mandatory every Legs session ***

(Glute Bridge at 0kg x 1 set was logged but is NOT a substitute for Hip Thrust Machine)

Core stabiliser (all sessions): 4 of 4 sessions -- OK

(Bird Dog logged every session; Dead Bug also present in Legs A)

Rear delt work in Pull sessions: 1 of 1 pull sessions -- OK

(Face Pull 3x15 @ 24.9kg + Chest Supported Y Raise in Tue Pull A)

Sessions over 60 min: ALL 4 sessions exceeded the 60-min cap

Mon 25 May Push A : 84 min (+24 min over cap)

Tue 26 May Pull A : 118 min (+58 min over cap)

Wed 27 May Legs A : 122 min (+62 min over cap)

Thu 28 May Push B : 103 min (+43 min over cap)

LATERAL RAISE (V-TAPER KPI):

This week : 10kg x 15 reps (best set, Thu 28 May)

Prior week : 12.5kg x 13 reps (best set, Sat 16 May)

Trend : DOWN (weight reduced 2.5kg; reps gained 2 but load is lower)

7. KEY INSIGHTS

RECOVERY AT 44

This week ran four consecutive sessions with every inter-session gap below the 48-hour minimum required for full muscle repair: Mon->Tue 26h, Tue->Wed 22h, Wed->Thu 23h. The most acute offender is Tue Pull A -> Wed Legs A at only 22h. Pull A loaded the back directly via Dumbbell Row, Shrug (Smith Machine), and Rack Pull; Legs A followed 22 hours later with Trap Bar Deadlift (95kg x 8) which also drives significant spinal erector and trap load. At age 44, back muscles need 48-72h between heavy sessions -- training them inside 22h adds accumulated fatigue, not stimulus, and raises injury risk materially.

Solution for W2: ensure at least one rest day between Pull and Legs sessions.

PPL ADHERENCE AND PROGRAMME AGE

This is W1 of the 6-day PPL x2 programme (started 2026-05-24). Of the 4 sessions completed this week, all 4 fell on the correct PPL day: Push A on Monday, Pull A on Tuesday, Legs A on Wednesday, Push B on Thursday. Adherence rate is 100% for completed sessions. The week is not yet closed -- Fri Pull B and Sat Legs B are still outstanding. No skip pattern is detectable after only one week, but the every-session over-run (84-122 min when 60 min is the cap) is a practical barrier to completing Fri and Sat if fatigue has been building across four back-to-back days.

CORRECTIVE COMPLIANCE

Hip Thrust hit rate this week: 0 of 1 Legs sessions (CRITICAL). The one Legs session (Wednesday Legs A) contained a 1-set Glute Bridge at 0kg but no Hip Thrust Machine. These are not equivalent: the Hip Thrust Machine generates far greater glute peak contraction and posterior pelvic tilt force than a bodyweight Glute Bridge, which is why it is the primary APT correction exercise. Skipping it for one full week is one missed opportunity to resist the tilt that currently places chronic load on the lumbar spine. It must appear in every Legs session. Rear delt set count: 9 sets this week, meeting the 8+ target (OK). This matters specifically at age 44: when anterior deltoids and pectorals are consistently stronger than the posterior cuff, the humeral head migrates forward in the glenoid socket. This narrows the subacromial space and creates impingement risk against the coracoacromial arch -- a common cause of rotator cuff tears in men over 40 who press heavily. The 9 rear delt sets this week keep this risk managed. Core stabiliser presence: 4 of 4 sessions included Bird Dog (T8-T12 correction). This is the strongest compliance metric this week and must be maintained.

LATERAL RAISE TREND -- V-TAPER KPI

The V-taper KPI is moving DOWN. The best Lateral Raise set dropped from 12.5kg x 13 reps (prior week, Sat 16 May) to 10kg x 15 reps (this week, Thu 28 May), a 2.5kg weight reduction. This matters specifically for Ganesh because love handles currently sit at approximately lat-width level, collapsing the visual waist-to-shoulder ratio. Shoulder width is the only lever available to create the V-taper illusion while fat loss is ongoing. A lateral deltoid that is regressing in load rather than progressing makes the waist appear wider, not narrower. The weight must return to 12.5kg and progress beyond it -- not retreat. The reps may have increased to 15 because the load was too light, which is another reason to add weight immediately in W2.

HARD FLAGS

(1) Overhead Triceps Extension Set 1 logged as 111 reps at 24kg -- this is a

data entry error in Hevy (111 instead of 11). It creates a false e1RM of 112.8kg

and will corrupt any automated tracking. Correct this in the Hevy app.

(2) Single Leg Press logged at 0kg for all 3 sets -- no load recorded. This exercise appears in both Legs A and the planned Legs B. A weight must be logged.

(3) Hip Thrust was entirely absent from Legs A -- the mandatory APT corrective was skipped on the only Legs session this week.

(4) All 4 sessions ran over 60 min (range: 84-122 min). The 60-min cap exists for cortisol management: sessions past 60-75 min at age 44 raise catabolic hormone levels that work against body recomposition. The 118-min Pull A and 122-min Legs A sessions are over twice the target and must be cut aggressively.

(5) Rack Pull weight dropped mid-session: Set 1 at 70kg x 5, Sets 2-3 dropped to 50kg x 8. This signals the opening weight was too high or the intent changed. Standardise all 3 sets at a single working weight (65kg) next session.

OVERALL VERDICT: DECLINING

Volume is down 8% vs last week (23,436 vs 25,376 kg*reps). Lateral Raise -- the primary V-taper KPI -- is trending down by 2.5kg. Hip Thrust (mandatory APT corrective) was skipped on the one Legs session completed. All 4 sessions breached the 60-min target, with two sessions running over 100 minutes. PPL schedule adherence is a bright spot (100% for completed sessions), but every quality metric -- corrective compliance, session duration, V-taper KPI -- is moving in the wrong direction in the first week of the new programme.
