

This Week's Training Summary

18 Aug – 24 Aug 2026 · Generated 25 Aug 2026 · Week 14 of PPL x2

HOW THIS WEEK WENT

- 

2 of 6 target sessions completed — only 33% of the weekly plan. Both sessions were Full Body (A & B), not the scheduled PPL sessions. Pull A, Push B, Pull B, and Legs B were all missed. Pattern holds over 4 weeks: 1, 2, 2, 2 sessions per week.

CRITICAL
- 

Bench Press improved to 60kg x 8 reps (e1RM 76kg) — up +4kg versus 03 Aug. All 3 sets completed cleanly with no rep collapse. Next session: 62.5kg x 8 reps.

OK
- 

Lateral Raise (V-taper KPI) hit 10kg x 15 reps this week, up from 10kg x 14 reps two weeks ago — trend UP. One more clean rep at 10kg triggers the move to 11.25kg. This is critical: Ganesh's love handles currently sit at lat-width level; only widening the shoulder frame through lateral delt progression can restore the V-ratio.

LOW
- 

Corrective compliance: 0% across all three markers. Zero Hip Thrust (APT correction absent all week). Zero rear delt sets (0 vs 8 target — if front delts stay dominant, rotator cuff impingement risk rises at 44). Zero core work (Dead Bug / Bird-Dog absent — T8–T12 kyphosis goes uncorrected). Deload also overdue: 7 active training weeks with no deload.

CRITICAL

DO THIS NEXT WEEK (W15 — DELOAD)

- 1

Deload all sessions: 2 working sets, same weights. W15 is the mandatory deload week — 7 weeks without one is overdue. Monday Push A: Bench 2 x 8 @ 60kg, OHP 2 x 7 @ 45kg. Wednesday Legs A: Squat 2 x 6 @ 70kg, Hip Thrust 2 x 10 @ 60kg. Drop Seated Leg Curl to 34.2kg after the rep collapse on 19 Aug.
- 2

Hit 8 rear delt sets this week — zero is not acceptable. Tuesday Pull A: Face Pull 2 x 15 @ 10kg. Friday Pull B: Rear Delt Reverse Fly 2 x 13 @ 10kg + Face Pull 2 x 15 @ 10kg. That's 4 rear delt sets on each Pull day — 8 total. At 44, skipping rear delts while pressing overhead is the documented path to rotator cuff impingement.
- 3

Hip Thrust in both Legs sessions, Dead Bug in every session. Wednesday Legs A and Saturday Legs B must each include Hip Thrust 2 x 10 @ 60kg — APT correction will not happen without it. Every single session (all 6 days) ends

with Dead Bug 3 x 10 or Bird-Dog 3 x 10/side — T8–T12 kyphosis is being ignored and the deload week is the ideal time to reset this habit. This is not optional.
